## DigitalMedia™ Room Controller & DM CAT Receiver with Side-Entry Connectors Now Available

### *DM-RMC-100-1 Makes Installation Easier*

Responding to dealer requests, the all-new DigitalMedia Room Controller is redesigned for even easier installation.

Now available, the DM-RMC-100-1 includes all the same connectivity as the previous room controller, except the connectors are relocated to either side rather than the rear of the receiver.

The new design allows more flexibility for cable runs and mounting location during installation. Dealers can now pull DM Cable outside of walls and take wider bends into the room controller, while surface mounting it on any flat surface.

"DM has been very popular and we wanted to give our customers what they've been asking for. So we designed the new box with that feedback in mind. Moving the connectors to the side not only helps relieve cable strain, but also make the LAN port more accessible. It also lets you mount the RMC on any flat surface without cutting out the wall. The RMC-100-1 is much more flexible than its predecessor, suiting both commercial and residential projects," says Daniel Jackson, Marketing and Development Engineer at Crestron.

The DM-RMC-100-1 DigitalMedia Room Controller receives a DM signal over DM cable and outputs HDMI, while providing control and connectivity for USB HID, Ethernet, IR, RS-232, contact closures and sensors.

The room controller can still be mounted to a 2-gang box if desired, but its connectivity does not require "behind-the-wall" real estate.
